Cheat Sheet: API's and Data Collection

```
Package/Method Description
                                                                                                        Code Example
                              Syntax:
                               1. 1
                               1. attribute = element[(attribute)]
                Access the
                value of a
                              Copied!
Accessing
                specific
element attribute attribute of an Example:
                HTML
                               1. 1
                element.
                               1. href = link_element[(href)]
                              Copied!
                              Syntax:
                               1. 1
                Parse the
                HTML content 1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                              Copied!
                using
               BeautifulSoup. Example:
BeautifulSoup()
                The parser
                type can vary
                               1. 1
                based on the
                               1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                project.
                              Syntax:
                Send a
                               1. 1
                DELETE
                request to
                               1. response = requests.delete(url)
                remove data or
                a resource
                              Copied!
                from the
delete()
                server.
                              Example:
                DELETE
                requests delete 1 \cdot 1
                a specified
                               1. response = requests.delete((https://api.example.com/delete))
                resource on
                the server.
                              Copied!
                              Syntax:
                               1. element = soup.find(tag, attrs)
                Find the first
                HTML
                              Copied!
                element that
find()
                matches the
                              Example:
                specified tag
                and attributes.
                               1. first_link = soup.find((a), {(class): (link)})
                              Copied!
                              Syntax:
                               1. elements = soup.find_all(tag, attrs)
                Find all
                HTML
                              Copied!
                elements that
find_all()
                              Example:
                match the
                specified tag
                               1. 1
                and attributes.
                               1. all_links = soup.find_all((a), {(class): (link)})
                              Copied!
                              Syntax:
                               1. children = element.findChildren()
                Find all child
                              Copied!
                elements of an
findChildren()
                HTML
                              Example:
```

```
element.
                                1. 1
                                1. child_elements = parent_div.findChildren()
                              Copied!
                Perform a
                GET request
                to retrieve data Syntax:
                from a
                specified URL. 1. 1
                GET requests
                                1. response = requests.get(url)
                are typically
                used for
                              Copied!
                reading data
get()
                from an API. Example:
                The response
                                1. 1
                variable will
                contain the
                                1. response = requests.get((https://api.example.com/data))
                server's
                response,
                              Copied!
                which you can
                process
                further.
                              Syntax:
                Include
                custom
                                1. 1
                headers in the
                request.
                                1. headers = {(HeaderName): (Value)}
                Headers can
                              Copied!
                provide
Headers
                additional
                              Example:
                information to
                the server.
                                1. 1
                such as
                authentication
                               1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = request
                tokens or
                              Copied!
                content types.
                              Syntax:
                Import the
                                1. 1
                necessary
Import Libraries
                Python
                                1. from bs4 import BeautifulSoup
                libraries for
                web scraping. Copied!
                Parse JSON
                response. This
                data from the
                extracts and
                                1. 1
                works with the
                                1. data = response.json()
                data returned
                by the API.
                              Copied!
                The
                response.json() Example:
json()
                method
                converts the
                JSON
                                2. 2
                response into a
                                1. response = requests.get((https://api.example.com/data))
2. data = response.json()
                Python data
                structure
                (usually a
                              Copied!
                dictionary or
                list).
                              Syntax:
                                1. 1
                                1. sibling = element.find_next_sibling()
                Find the next Copied!
                sibling
next_sibling()
                element in the Example:
                DOM.
                                1. 1
                                1. next_sibling = current_element.find_next_sibling()
                              Copied!
                              Syntax:
                                1. 1
                                1. parent = element.parent
                Access the
```

```
parent element Copied!
                 in the
parent
                 Document
                                Example:
                 Object Model
                                  1. 1
                 (DOM).
                                  1. parent_div = paragraph.parent
                                Copied!
                 Send a POST
                                Syntax:
                 request to a
                  specified URL
                 with data.
                 Create or

    response = requests.post(url, data)

                 update POST
                 requests using Copied!
post()
                 resources on
                 the server. The Example:
                 data parameter
                                  1. 1
                 contains the
                                 1. response = requests.post((https://api.example.com/submit), data={(kev): (value)})
                 data to send to
                 the server,
                 often in JSON Copied!
                 format.
                 Send a PUT
                 request to
                                Syntax:
                 update data on
                 the server.
                                  1. 1
                 PUT requests
                                  1. response = requests.put(url, data)
                 are used to
                 update an
                                Copied!
                 existing
put()
                 resource on
                                Example:
                 the server with
                 the data
                 provided in the
                                  1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                 data
                 parameter,
                                Copied!
                 typically in
                 JSON format.
                                Syntax:
                 Pass query
                                  1. params = {(param_name): (value)}
                 parameters in
                 the URL to
                                Copied!
                 filter or
                 customize the Example:
Query parameters request. Query
                 parameters
                                  2.
                 specify
                                  3. 3
                 conditions or
                                  1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                 limits for the
                 requested data.
                                Copied!
                                Syntax:
                                  1. 1
                                  1. element = soup.select(selector)
                 Select HTML
                                Copied!
                 elements from
                 the parsed
select()
                 HTML using a Example:
                 CSS selector.
                                  1. 1
                                  1. titles = soup.select((h1))
                                Copied!
                 Check the
                                Syntax:
                 HTTP status
                 code of the
                                  1. 1
                 response. The

    response.status_code

                 HTTP status
                 code indicates Copied!
                 the result of
                 the request
                                Example:
status_code
                 (success, error,
                 redirection).
```

```
Use the HTTP
                       status codeIt
                      can be used for
                      can be used for
error handling
1. url = "https://api.example.com/data"
2. response = requests.get(url)
                       and decision-
                                            3. status_code = response.status_code
                      making in
                                          Copied!
                      your code.
                                          Tag Example:
                                            2. 2
3. 3
                       Specify any
                      valid HTML
                      tag as the tag
                       parameter to
                       search for
                                           10. 10
                       elements of
tags for find()
                      that type. Here
                                           1. - (a): Find anchor () tags.
and find_all()
                      are some
                                            2. - (p): Find paragraph ((p)) tags.
